

Set 15

Procedure

- Prepare the **Monthly Product Sales** dataset and import the CSV file into Tableau.
- In the **Data Source** tab, select the monthly sales columns (January Sales, February Sales, and March Sales) and use the **Pivot** option to convert them into Month and Sales fields for easier analysis.
- Create a **Grouped Bar Chart** by placing Product Name and Month on the Columns shelf, Sales on the Rows shelf, and using different colors for each month to compare product sales.
- Create a **Stacked Area Chart** by placing Month on the Columns shelf, Sales on the Rows shelf, and Product Name on Color to visualize the overall sales trend across all products over the three months.
- Create a **Text Table** by displaying Product Name, Month, and Sales values to show detailed monthly sales information for each product.
- Format all worksheets by adding appropriate titles, axis labels, legends, and tooltips to improve readability and presentation.
- Create a **Dashboard**, add the grouped bar chart, stacked area chart, and sales table, arrange them neatly, enable interactive filtering, and save the workbook for analysis.
